Searching Algorithms Worksheet

Worksheet 3

- 1) How many loops would be required to find the 3rd item in the list using linear search?
10 49 17 41 56 74

- 2) Why would linear search be required for the list below?
12 91 51 91 22 44

- 3) Show the steps required to find the 4th item in the list below using linear search.

86 46 45 86 68 6

- 4) Show the steps in pseudocode required to find the number 86 item in the list above using binary search.

- 5) Which algorithm would be most efficient for an unordered list containing 97 items?

08/10/2021

Searching Algorithms

Answer Sheet

Worksheet 3

- 1) It would require 3 iterations as linear search checks each item in turn from the 1st item.
- 2) The list is not in order which means that only linear search can access the data
- 3) Start at index 0. Check if this is the item of data to be found. If not, move onto to index 1 and check again. Repeat this until index 3 is reached, then stop.
- 4) $low = 0, \quad high = 5, \quad mid = (high - low) / 2$
- ```
search = 86
found = FALSE
WHILE found == FALSE AND low < high DO
 IF arr[mid] == search THEN
 OUTPUT "Item found at " + STR(mid)
 ELSE IF mid < search THEN
 low = mid
 mid = (high-low)/2
 ELSE
 high = mid
 mid = (high-low)/2
 END IF
END WHILE
```
- 5) Only linear search could be used in this instance, as the data is unordered.
